The LED chip purchase from well-know brands, bring out soft Luminous efficiency, they have low attenuation and long life. The lens purchase from high quality products, which have good transparency, high luminous efficiency, to make the well-distributed brightness.

We use the most advanced high precision SMT machine to make sure that the LED chip and lens are in the correct position. And use the professional glue to stabilize the lens and keep it from falling off.

Through the principle of optical refraction, the angle of light refraction is accurately calculated, and the LED illumination is reasonably distributed. Inside the lampshade, the LED light source forms 180° no dead angle light, clears the glare to clear the video fatigue, and then doubles the light through the lens layer to make the light brighter.
